**México: Baja California Sur:** Municipality of Mulegé: Santa Rosalía (27.32805°N, 112.25817°W, 52 m a.s.l.), one individual found (on line record: Naturalista 55355814; Fig. 1) on 3 August 2020, and a second record (on line record: Naturalista 56423518) found on 14 August 2020 by D. Castro (CONABIO, 2020), and verified by Edward L. Ervin. This represents the first record of the Mediterranean House Gecko (*Hemidactylus turcicus*) in the Municipality of Mulegé, Baja California Sur (Grismer, 2002; Fig. 2), and the second state record of this species. The first record of *H. turcicus* in Baja California Sur is an unpublished museum specimen from the Museo de Zoología Alfonso L. Herrera (MZFC 6582), at Universidad Nacional Autónoma de México, collected on 17 May 1994 in Loreto, Municipality of Loreto (GBIF, 2020), ca. 170 km (airline) south of Santa Rosalía. The status of this invasive gecko in Loreto is unknown, but previous records of the Common House Gecko (*Hemidactylus frenatus*) have been made from this locality (Luja et al., 2011). The adult gecko from Santa Rosalía was found active in a house wall at 21:33 h. The second gecko was a juvenile found at 20:32 h on a building wall in the Port of Santa Rosalía. A population appears to be established at this locality since several other individuals have been seen in the area (D. Castro-Gutiérrez pers. observ.).
